17 Short title: Effects of sub-lethal concentrations of mupirocin on *S. aureus*

18

19

20 **Abstract**

21 *Staphylococcus aureus* is a major pathogen in both hospital and community settings
22 causing infections ranging from mild skin and wound infections to life-threatening
23 systemic illness. Gene expression changes due to the stringent response have been
24 studied in *Staphylococcus aureus* using lethal concentrations of mupirocin but no
25 studies have investigated the effects of sub-lethal concentrations. *S. aureus* 8325-4
26 was exposed to sub-inhibitory concentrations of mupirocin. The production of ppGpp
27 was determined via HPLC and the effects on global transcription were studied by
28 RNAseq analysis. Growth inhibition had occurred after 1 h of treatment and
29 metabolic analysis revealed that the stringent response alarmone ppGpp was
30 detected and GTP concentrations decreased. Transcriptome profiles showed that
31 global transcriptional alterations were similar to those for *S. aureus* after treatment
32 with lethal concentrations of mupirocin including the repression of genes involved in
33 transcription, translation and replication machineries. Furthermore, up-regulation for
34 genes involved in stress responses, amino acid biosynthesis and transport as well as
35 for some virulence factor genes was observed. However, ppGpp was not detectable
36 after 12 or 24 h and cell growth had resumed although some transcriptional changes
37 remained. Sub-lethal concentrations of mupirocin induce the stringent response but
38 cells adapt and resume growth once ppGpp levels decrease.

43 **Introduction**

44 Mupirocin is an antibiotic that is used to treat superficial staphylococcal infections
45 and to clear nasal carriage (Coates *et al.*, 2009). Mupirocin triggers the stringent
46 response *via* inhibition of isoleucine aminoacylation leading to unchanged tRNA
47 accumulation which mimics amino-acid starvation. In *Staphylococcus aureus* and
48 other bacteria this induces the stringent response via to the production of the global
49 regulator (p)ppGpp (Cassels *et al.*, 1995; Anderson *et al.*, 2006). RSH (RelA/SpoT
50 Homologue or Rel in the nomenclature recommended by Mittenhuber (Mittenhuber,
51 2001) is the main enzyme responsible for (p)ppGpp synthesis and hydrolysis in
52 Gram-positive bacteria including *S. aureus* *via* the enzymatic phosphorylation of
53 GDP and GTP to pppGpp using ATP as a phosphate donor (Potrykus & Cashel,
54 2008; Wolz *et al.*, 2010). pppGpp is rapidly hydrolysed by pppGpp
55 phosphohydrolase to ppGpp in *S. aureus* (Hara & Sy, 1983). (p)ppGpp is
56 responsible for regulating global intracellular changes including transcription,
57 translation, replication and virulence factor induction in pathogenic bacteria (Wolz,
58 Geiger *et al.*, 2010) including *S. aureus*. Observations of global alterations in gene
59 transcription after mupirocin treatment have been conducted in previous studies via
60 DNA microarray and these studies used inhibitory (lethal) concentrations of
61 mupirocin for relatively short exposure times, as ppGpp acted as a toxin and treated
62 cells entered the death phase after a few hours of exposure (Geiger *et al.*, 2010;
63 Geiger *et al.*, 2012; Reiß *et al.*, 2012). In addition to direct effects of ppGpp on
64 transcription, indirect mechanisms of action of the ppGpp can occur via the
65 consumption of GTP through (p)ppGpp synthesis. For example, reduction in the
66 concentration of GTP will reduce the repressive activity of CodY and lead to further

67 transcriptional alterations, in particular for genes that are involved in nitrogen and
68 amino acid metabolism and those encoding virulence factors (Sonenshein, 2005).

69 Relatively little is known about the effects of sub-inhibitory concentrations of
70 mupirocin in *S. aureus*. In a previous study the production of some virulence factors
71 was delayed but not completely inhibited (Edwards-Jones & Foster, 1994; Edwards-
72 Jones 1997). In this work, *S. aureus* strain 8325-4 was treated with sub-lethal
73 concentrations of mupirocin and production of ppGpp determined by HPLC and
74 associated global transcriptional alterations were studied via high throughput RNA-
75 sequencing which has not been performed in previous studies. In addition,
76 resumption of growth after the stringent response was spotted for first time and
77 observed at the transcriptional level. In this work a model of recovery mechanism
78 from the stringent response is proposed. The implications for therapy with mupirocin
79 are discussed.

80

81 **Materials and methods**

82 *Mupirocin treatment and nucleotide detection*

83 A sub-inhibitory concentration of mupirocin ($0.5 \times \text{MIC} = 0.12 \mu\text{g/ml}$) was added to
84 exponentially growing cells (OD 0.5) of *S. aureus* 8325-4 in Iso-sensitest Broth
85 (Oxoid, Basingstoke, UK) and placed in a rotary incubator at 37°C and 200 r.p.m.
86 Cells were harvested after 1, 12 and 24 h in parallel with control cultures and their
87 OD determined (cultures were diluted when the OD600 nm reading reached 0.7 then
88 multiplied by the dilution factor). Nucleotide extraction was performed following
89 Greenway and England (Greenway & England, 1999) with slight modifications.
90 Bacterial broth (40 ml) was filtered through filter paper (Millipore 0.45 µm pore size),

91 then 5 ml of 2M ice cold formic acid was added to the culture and incubated on ice
92 for 1 h. Cell debris was removed by centrifugation for 10 min at 6000 x g, and the
93 supernatant was filtered through a nitrocellulose membrane (Whatman 0.45 µm pore
94 size). The filtrates were then frozen using liquid nitrogen, dried by lyophilisation
95 (Coolsafe TM, Scanvac) for 48 h and then kept at 4°C. The lyophilised extract was
96 dissolved in 3 ml of highly purified de-ionised distilled water and 1 ml then injected
97 into HPLC (Polaris,Varian) using a Partisil 10 SAX anion exchange column
98 (Whatman) and eluted with a with gradient of 7mM K₂HPO₄, pH 4.0 to 0.5 M
99 K₂HPO₄/0.5 M Na₂SO₄, pH 5.4 at a flow rate of 1 ml min⁻¹. The detection wavelength
100 (UV) was 254nm. Nucleotide concentrations were expressed relatively to the cell dry
101 weight.

102 *RNA extraction*

103 Cells were harvested after 1, 12 and 24 h as before. The optical densities were
104 adjusted to 0.5 at 600 nm for normalization then RNAProtect® Bacteria Reagent and
105 RNeasy® Mini Kit (Qiagen) reagents were used to extract total RNA. DNase I
106 (Qiagen) was included in the RNA extraction procedures to avoid DNA
107 contamination. Purity of RNA was verified by Nanodrop spectrophotometer 2000
108 (Thermo Scientific) and accurate RNA concentration measurements were obtained
109 via Qubit™ RNA Assay Kits with a Qubit® 2.0 Fluorometer (Life Technologies,
110 Paisley, UK).

111 *RNA library preparation and sequencing*

112 RNA-seq and data analysis were performed at the Centre for Genomic Research
113 (CGR) at Liverpool University, UK. Non-coding RNAs were depleted from the
114 samples via RiboZero Magnetic kit (Bacteria; Catalogue No. MRZB12424) from

115 Epicentre using 2 µg of starting material. RNA-seq libraries were prepared from 20-
116 25 ng of the enriched material using the Epicentre ScriptSeq v2 RNA-Seq Library
117 Preparation Kit (Catalogue No. SSV21106) and the libraries were purified using
118 AMPure XP beads after 13 cycles of amplification. These final libraries were pooled
119 in equimolar amounts and quantity and quality of each pool was assessed by
120 Bioanalyzer and subsequently by qPCR using the Illumina Library Quantification Kit
121 from Kapa (KK4854) on a Roche Light Cycler LC480II according to the
122 manufacturer's instructions. The resultant pools were sequenced on 3 lanes of the
123 HiSeq 2000 using 2x100 bp paired-end sequencing with v3 chemistry. The mapping
124 tools were Bowtie 2.1.0 using paired-end mapping mode. Analysis software was R
125 version 3.0.1 and edgeR package version 3.0.4.

126 *Data analysis*

127 Three types of analysis were conducted on the expression data results. Firstly,
128 based on \log_2 count, sample correlation analysis was performed to examine the
129 variation within sample replicates and between samples groups. Secondly, analysis
130 was made by forming a model of six parameters each parameter is for the mean
131 expression of sample replicates. The parameters were C 1 h, T 1 h, C 12 h, T 12 h ,
132 C 24 h and T 24 h (where C= control and T= culture challenged with mupirocin) then
133 comparison of the expression data of control and test cells for each sample (T1 h/C1
134 h, T12 h/C12 h and T24 h/C24 h) were conducted to identify differentially expressed
135 genes based on a cut off level of $\leq 5\%$ for False Discovery Rate (FDR) values and 2-
136 fold change in expression (FDR = $\leq 5\%$ PLUS 2-fold change). Thirdly, comparison of
137 the expression data of test cells parameters (T12 h/T1 h, T24 h/T1 h and T24 h/T12
138 h) were set to identify differentially expressed genes at these time points using the

139 same criteria. The full RNAseq data is given in the accompanying supplementary file
140 Table 1.

141 Gene annotations were obtained from the National Center for Biotechnology
142 Information (NCBI);
143 <http://www.ncbi.nlm.nih.gov/Taxonomy/Browser/wwwtax.cgi?mode=Info&id=93061&l>
144 &vl=3&lin=f&keep=1&srchmode=1&unlock) and further annotations were obtained
145 from the Pathosystem Resource Integration Centre (PATRIC)
146 (<http://patricbrc.vbi.vt.edu/portal/portal/patric/Home>). Gene grouping based on their
147 functions was conducted using the DAVID server
148 (<http://david.abcc.ncifcrf.gov/home.jsp>).

149 **Results**

150 *Effect of sub-inhibitory concentration of mupirocin on cell growth and ppGpp*
151 *production*
152 The effect of a sublethal (0.5 MIC) concentration of mupirocin on growth of *S. aureus*
153 8325-4 is shown in Figure 1. Different times for sampling were chosen h to observe
154 the effect of mupirocin addition on growth and gene expression (1, 12 and 24 h). The
155 1 h time point was in the early exponential phase for the control cells and growth was
156 inhibited after mupirocin addition to test cells. After 12 h control cells were in
157 exponential phase and test cells showed the beginnings of recovery from the
158 stringent response. At 24 h, control cells were in the stationary phase whereas the
159 test cells were in exponential phase. There was a significant effect on growth up to
160 24 h with an apparently prolonged lag phase for the treated cells. After 1 h OD 600
161 nm for control cells reached 1.2 whereas the treated cells remained constant at 0.5, a
162 significant difference (P= 0.02). Then mupirocin had a highly significant effect (P =
163 0.0006) on 12 h cultures as the control cells OD reached 6.5 whereas that of the

164 treated cells was 2.6. After 24 h control cells OD reached 10.4 and the test cells rose
165 to 5.8, significantly lower than the controls ($P = 0.002$) but similar to the OD of 12 h
166 control cells (Figure 1). ppGpp was detected after 1 h exposure to mupirocin (397
167 pmole mgCDW $^{-1}$) but reduced to 0 after 8 h (not shown) and was still undetectable
168 after 12 or 24 h (Figure 1). ppGpp was not detected in the control cells. GTP was 6.8 ± 4.7
169 nmole mgCDW $^{-1}$ in control cells and 2.4 ± 1.7 nmole mgCDW $^{-1}$ in mupirocin
170 treated cells after 1 h then slowly increased to pre-mupirocin levels by 8 h (data not
171 shown). Levels were comparable to control cells after 12 h in mupirocin treated cells.

172

173 *Global gene expression*

174 RNA was extracted from cells treated with mupirocin and controls after 1, 12 and 24
175 h and was analysed by high throughput RNA sequencing to observe the global
176 alterations in transcription. Transcription profiles based on expression level changes
177 for genes were obtained and comparisons of these profiles were made between all
178 samples in order to observe correlation between their transcription profiles and are
179 presented as a heatmap (Figure 2). Each square shows the level of correlation
180 between the corresponding samples where red indicates high correlation and dark
181 blue low correlation. For example, arrow (A) indicates a high level of similarity of the
182 transcriptional profile for control cells at 12 h and the transcriptional profile for cells
183 treated with mupirocin at 24 h. Furthermore, significant similarity of transcriptional
184 profiles occurred among cells treated with mupirocin for samples at 1 and 12 h which
185 indicate similar expression regulation for their genes (arrow B Figure 2). All genes
186 were subjected to a two-fold differential expression cut-off at FDR ≤ 0.05 .

187

188 *Comparison between gene expression in test and controls at different times*

189 *Differential gene expression throughout sublethal mupirocin exposure*

190 Expression data for 2,862 genes was obtained for all three time points. After 1 h of
191 exposure to sublethal concentrations of mupirocin, 869 (30.3%) were differentially
192 expressed between treated samples and controls. 55.12% (n = 479) up-regulated
193 and 44.8% (n = 390) down-regulated.

194 After 12 h of sublethal mupirocin exposure, 967 genes were differentially expressed
195 between treated samples and controls (33.8%, an increase of 3.5% from 1 h). 52.9%
196 (n = 512) of the differentially expressed genes were up-regulated and 47.1% (n= 197 455) were down-regulated.

198 After 24 h of sublethal mupirocin exposure, 1,125 genes were differentially
199 expressed between treated samples and controls (39.3%, an increase of 9% from 1
200 h). Of the differentially expressed genes, 56.6% (n = 637 were up-regulated and
201 43.3% (n = 488) were down-regulated.

202

203 *Distribution of the differentially expressed genes of the test and control cells after 1, 12
204 and 24 h.*

205 A Venn diagram of differentially expressed genes between time points is shown in
206 Figure 3. For example, at 1 h 146 genes were up-regulated and 206 were down-
207 regulated, 279 genes were up-regulated and 311 genes were down-regulated at 12 h,
208 and 508 up-regulated and 443 down-regulated at 24 h (Figure 3). 229 up-regulated
209 genes and 142 down-regulated genes were common to both 1 and 12 h, and between 1
210 h and 24 h, 125 up-regulated genes and 43 down-regulated genes were shared,

211 respectively. There were 25 positively regulated and 3 negatively regulated genes that
212 overlapped between 12 h and 24 h.

213 *Functions of uniquely expressed genes*

214 Differentially expressed genes that showed unique regulation at different times were
215 classified for gene function using gene functional classification toll server (DAVID
216 Bioinformatics Resource) and the results are shown in Figure 3. For example, at 1 h
217 up-regulated genes were enriched for functions including cofactors binding, cellular
218 amino acid biosynthetic process and carboxylic acid biosynthetic processes. Down-
219 regulated genes contributed to energy production, coenzyme metabolic biosynthetic
220 process and DNA replication. At 12 h, up-regulated genes were largely involved in
221 ion and cofactor binding, coenzyme metabolic process, nucleotide biosynthetic
222 processes and glycolysis. Down-regulated gene annotations were enriched for terms
223 including cellular carbohydrates biosynthetic process, two component systems, and
224 signal transduction and regulator response. Finally, genes involved in phosphate
225 metabolic process, two component systems, nucleotide binding, GTP binding,
226 energy production and conversion were up-regulated at 24 h and those involved in
227 transcription regulation, cellular response to stress, regulation of RNA metabolic
228 process and DNA binding were down-regulated (Figure 3).

229 *Functions of overlapping expressed genes*

230 Genes which showed overlap in expression (i.e. were either up-or down-regulated at
231 more than one timepoint) were studied in more detail. For example, pairwise
232 comparison of transcriptomes from the 1 and 12 h - long treatments (against control
233 cells) revealed shared up-regulated genes involved in branched chain amino acid

234 (BCAAs) biosynthesis processes, carboxylic acid and nitrogen compound
235 biosynthetic processes, transcription regulation and stress response Figure 3

236 Transcription data for these genes display significant alterations on their regulation
237 during the stringent response (Table 1). Genes down-regulated at both 1 h and 12 h
238 included nucleoside and nucleotide biosynthetic processes and binding, phosphate
239 metabolism processes, trans-membrane and phosphorylation (Figure 3).

240 Genes that were up-regulated at both 1 h and 24 h were involved in functions
241 including cellular amino acid biosynthesis, two component system and pathogenesis.
242 Down-regulated genes at both 1 h and 24 h were involved in carbohydrate metabolic
243 processes, nucleotide and coenzyme binding and lactose metabolism (Figure 3).

244

245 Pairwise comparison of the 12 and 24 h transcriptome data showed shared function
246 of up-regulated genes including transmembrane, amine biosynthetic processes,
247 cellular amino acid biosynthesis, virulence and two component systems.

248 Twenty one 21 genes were up-regulated at all three time points, 10 of which coded
249 unknown function products. The remaining 11 genes were involved in cellular amino
250 acid biosynthesis, virulence and two component systems (Figure 3).

251 Details of the main transcription changes are shown in Table 1 (up-regulated genes)
252 and Table 2 (down-regulated genes). Up-regulated genes after 1 h included large
253 increases in amino-acid biosynthesis and transport, stress response, nitrogen
254 component biosynthetic processes (Table 1), In most cases these were lower
255 increases by 12 h and reduced further by 24 h. Exceptions include for

256 isopropylmalate isomerase and isoleucyl tRNA synthetase which were still
257 upregulated more than 5 fold over the control cultures (Table 1).

258 Genes that were down regulated after 1 h of mupirocin treatment were those
259 involved in DNA replication, carbohydrate metabolism, protein synthesis and
260 nucleotide metabolism. Most of these were upregulated again by 24 h (Table 2).

261 *Expression of genes that facilitate the recovery from stringent response after*
262 *mupirocin treatment*

263 The slow increase in growth that occurred after 12 h exposure to sub-lethal
264 concentrations of mupirocin was associated with decreased level of RSH transcript
265 and ppGpp was not detected at 12 h. Furthermore, activation of genes involved in
266 transcription, translation, replication, energy production and transport were seen in
267 the transcriptome data for 12 h, 24 h or both. In addition, the gene encoding *IlleS*
268 (*SAOUHSC_01159*) was up-regulated at 1, 12 and 24 h (9.7, 4.3 and 5.2 fold)
269 respectively (Table 1). Moreover, up-regulation for genes involved in branched chain
270 amino acid (isoleucine, valine and leucine) biosynthesis and metabolism processes,
271 as well as genes coding for proteases and amino acid transport had occurred and
272 more than 30 genes that encoded for ribosomal proteins were significantly up-
273 regulated after 24 h. The transcriptome data also showed slight but not all significant
274 up-regulation of genes that contribute to GTP synthesis at 12 and 24 h including
275 *HprT* (1.1 fold and 1.5 fold), and *GmK* (1.2 fold and 2.5 fold) respectively.

276 **Discussion**

277 The sub-lethal concentration of mupirocin induced the stringent response and ppGpp
278 was present after 1 h but was undetectable after 4 h (data not shown). The changes

279 in gene expression observed after 1 h treatment were broadly similar to those
280 reported using DNA microarrays and lethal concentrations of mupirocin (Anderson *et*
281 *al.*, 2006; Geiger, *et al.*, 2010; Geiger,,*et al.*, 2012). However, the observation that
282 changes in gene expression occur 12 and 24 h after exposure to mupirocin has not
283 been observed before and show that transcription changes still occur even after the
284 cells have apparently recovered from the stringent response. The transcription of the
285 gene that is responsible for ppGpp synthesis, *rsh* was increased 1.2 fold relatively to
286 the control at 1 h. Although this was not a significant increase in the expression
287 according to the criteria used here, ppGpp production reached significant levels in
288 comparison to control condition and the low level of expression might be related to
289 the level of the stringent response caused by the sublethal concentration of
290 mupirocin. In *S. aureus* there are two additional genes *RelP* and *RelQ* that code for
291 proteins that synthesise ppGpp. However, the expression of *RelQ* and *RelP* genes
292 was down-regulated at 1 h (1, 1.4 fold) respectively. Recent works for Geiger and his
293 research group claimed the *RelQ* and *RelP* were not active during amino acid
294 starvation and mupirocin exposure (Geiger *et al.*, 2012; Geiger *et al.*, 2010) but had
295 a significant role in mediating tolerance against cell envelope stress after exposure
296 to cell wall-active antibiotics such as ampicillin and vancomycin (Geiger *et al.*, 2014).
297 Up-regulation of genes that are involved in amino acid biosynthesis, transcription
298 regulation, stress response, virulence factors and the down-regulation of genes that
299 contribute to transcription, translation and replication are in agreement with previous
300 observations using lethal concentrations of mupirocin (Anderson *et al.*, 2006;
301 Geiger,*et al.*, 2010; Geiger *et al.*, 2012; Reiß,,*et al.*, 2012), and supports the view
302 that the sublethal concentration of mupirocin used here was capable of triggering the

303 stringent response during at least 1 h of treatment which has not been reported in
304 previous studies.

305 Significant growth inhibition was seen at 1h after mupirocin exposure compared to
306 control cells this was due to ppGpp influencing on DNA replication as has been
307 shown in *B. subtilis* and *E.coli* (Schreiber *et al.*, 1995a; Levine *et al.*, 1991).
308 However, the effective mechanism of ppGpp on DNA replication in *S. aureus* is
309 unknown at the present, but transcriptome profile for the treated cell at 1 h showed
310 down-regulation for genes that are involved in nucleoside biosynthetic processes
311 and DNA replication including genes coding for replication initiation proteins and
312 DNA gyrase subunit A-B (Table 2) and these findings are in line with the decreased
313 cell density seen in figure 1 at 1 h in treated cells compared to controls. In addition,
314 two genes coding for toxin/antitoxin systems were up-regulated at 1 h which is in
315 agreement with (Reiß *et al.*, 2012) however, positive transcription for them had
316 occurred at 12 h despite the increasing cells OD and that might be a case of
317 opposite regulation between transcription and translation for them but this would
318 need to be confirmed by proteomics.

319 In this study RNA-seq technology was used to obtain a comprehensive view of the
320 effect of the stringent response on *S. aureus* 8325-4 transcription. However, the data
321 revealed that the highest proportions (63.8%), of up-regulated genes during the
322 stringent response at 1 h encoded hypothetical proteins and this finding is in line with
323 (Reiß *et al.*, 2012) which reflects the lack of knowledge of the stress response
324 process. .

325 During the stringent response induced by inhibitory concentrations of mupirocin the
326 GTP concentration in the intracellular pool was also reduced through the (p)ppGpp

327 synthesis process. In *B.subtilis* most of the rRNA gene transcription starts with
328 guanosine nucleotides, expression of which can consequently be influenced by GTP
329 intracellular levels (Krásny & Gourse, 2004). Transcriptional start of two rRNA
330 operons in *S. aureus* have been mapped and have confirmed GTP's role in initiating
331 their primary promoters, which can explain the effects of low GTP concentrations on
332 their expression (Krásný *et al.* 2008; Geiger *et al.*, 2012). Furthermore, decreased
333 GTP concentrations caused by mupirocin treatment would decrease the
334 concentration of CodY–GTP complex, resulting in de-repression for amino acid
335 biosynthesis and transport genes as well as many virulence factors genes in *S.*
336 *aureus* (Hughes & Mellows, 1978; Majerczyk *et al.*, 2010). Quorum sensing,
337 particularly the *agr* locus and other virulence genes, are clearly influenced during
338 stringent response as a result of CodY deactivation, which might explain the
339 correlation between nutrient limitation and enhanced expression of virulence factors
340 during the stringent response.

341 However, recovery from the stringent response was observed as the treated cells
342 slowly returned to growth associated with decreased level of *rsh* transcript and
343 ppGpp was not detected at 4 or 12 h. A model for the inhibition and escape from
344 inhibition is shown in Figure 4. The reason for down-regulated transcription of *rsh* is
345 not clear yet but it is possible that stopping ppGpp synthesis can be achieved via
346 reducing the concentration of its inducer, deacylated tRNA, in the A-site of ribosome
347 that is caused by mupirocin treatment. Mupirocin works as a reversible competitive
348 enzyme inhibitor that inhibits the synthesis of the isoleucyl-tRNA_{Ile}. Recovery from
349 such competitive enzyme inhibitor effect can be achieved via increasing either the
350 concentration of the targeted enzyme, IleS, or its substrate, isoleucine (Hughes &
351 Mellows, 1978). Here, the gene coding for IleS (SAOUHSC_01159) was up-

regulated at 1, 12 and 24 h (9.7, 4.3 and 5.2 fold) respectively, which may suggest that a cell treated with mupirocin is trying to overcome the inhibitory effect of mupirocin by producing higher concentrations of IleS enzyme than its inhibitor. In addition, up-regulation for genes that are involved in isoleucine, valine and leucine biosynthesis and metabolism processes was reported here which is in agreement with Reiß and colleagues when they reported early increase of branched chain amino acids after 30 min of treatment with lethal concentrations of mupirocin *et al.*, 2012). Furthermore, up-regulation for genes that coding for proteases and amino acid transport had occurred which supports the suggestion that *S. aureus* tries to compensate for the lack of amino acids *via* biosynthesis as well as through importing amino acids from the surrounding environment or host tissue. Hydrolysis will also decrease ppGpp concentrations which will be complete if synthesis is inhibited. Activation of genes that are involved in transcription, translation, replication, energy production and transport were seen in the transcriptome data for either or both 12 h and 24 h and reflects cell growth at these times. An early study on *E. coli* stringent response claimed that cessation of (p)ppGpp synthesis and accumulation would occur as long as ribosomes are actively engaged in protein synthesis which might explain the undetectable (p)ppGpp at 12 and 24 h (Cashel & Gallant, 1969). This finding along with the heatmap results which show a similar transcriptome profile between 12 h control cells and 24 h test cells again suggests cell recovery from the effects of the stringent response and recommencing growth.

In conclusion, sub-inhibitory concentrations of mupirocin were able to trigger the stringent response in *S. aureus* 8325-4 at 1 h and a high proportion of the up-regulated genes during the stringent response encoded proteins of unknown functions. The results show that strain 8325-4 is able to react during the stringent

377 response despite being deficient in sigma factor B (sigB) as the majority of the
378 previously reported changes on a strain without the rsbU deletion after treatment
379 with lethal concentrations of mupirocin were repeated here. Early report by Crosse
380 and colleagues showed the ability of *S.aureus* 8325-4 to trigger stringent response
381 despite being deficient in sigma factor B (sigB) (Crosse et al., 2000) which is in line
382 with this work and support the proposal that (sigB) is not the major factor in
383 mediating the stringent response. Triggering the stringent response by sub-lethal
384 concentration of mupirocin appears to induce *IleS* production in an attempt to
385 compete with mupirocin which is sufficient to lead to prevention of ppGpp synthesis
386 and accumulation after 4 h. The concentration of ppGpp would also be reduced by
387 hydrolysis. This is different from lethal concentrations of mupirocin that resulted in
388 cell death after a few hours of exposure in previous studies because of the toxic
389 nature of ppGpp. Consequently, the treated cells survived and recovered from the
390 stringent response and resumed growth at 12 and 24 h. Regulation of virulence
391 genes in *S.aureus* during the stringent response is related to the GTP intracellular
392 level and *CodY* regulatory protein.

393 The results obtained in this study showed that, as may occur in infections treated
394 with mupirocin, there was enhanced expression of virulence genes. This and the
395 implications for therapy with mupirocin will be investigated in detail in a second
396 publication. However, the suggested recovery mechanism for resumed growth by
397 reduction of ppGpp levels might be a useful drug target e.g. by maintaining ppGpp
398 levels by inhibition of the hydrolase activity.

399

400 **Supplementary Files**

401 The full RNAseq data is given in supplementary Table 1.

402 **Acknowledgements**

403 We would like to thank GlaxoSmithKline for the gift of mupirocin and the Centre for
404 Genomic Research at the University of Liverpool for their cooperation in RNA-seq
405 technology. The authors have no conflicts of interest.

591

592

593 **Figure 4 model for the escape from inhibition after exspusre to sub-lethal
594 concentration of mupirocin**

595 (a) uncharged tRNA caused by mupirocin induces ppGpp sythesis which reduces
596 GTP concentration resulting in growth inhibition. (b) antagonism of mupirocin effect
597 via up-regulation of *iieS* and increase of GTP synthesis leads to ppGpp hydrolysis,
598 restoring the translation machinary activities and resumption of growth.

hypothetical protein
hypothetical protein
PTS system glucose-specific transporter subunit IIABC

Sheet1

pyruvate oxidase
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
LysM domain-containing protein
hypothetical protein
hypothetical protein
hypothetical protein
hydroxymethylglutaryl-CoA reductase
HMG-CoA synthase
methylated-DNA--protein-cysteine methyltransferase
ATP-dependent Clp protease ATP-binding subunit ClpC
hypothetical protein
ferrous iron transport protein B
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
1-pyrroline-5-carboxylate dehydrogenase
hypothetical protein
hypothetical protein
cation transporter E1-E2 family ATPase
cation transporter E1-E2 family ATPase
D-lactate dehydrogenase
hypothetical protein
squalene synthase
squalene desaturase
hypothetical protein
hypothetical protein
hypothetical protein
LysM domain-containing protein
hypothetical protein
hypothetical protein
immunodominant antigen A
hypothetical protein
NA
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein

Sheet1

dihydroorotate dehydrogenase 2
hypothetical protein
aspartate alpha-decarboxylase
pantoate--beta-alanine ligase
3-methyl-2-oxobutanoate hydroxymethyltransferase
2-dehydropantoate 2-reductase
alpha-acetolactate decarboxylase
L-lactate dehydrogenase
hypothetical protein
4-aminobutyrate aminotransferase
hypothetical protein
fructose-1%2C6-bisphosphate aldolase
malate:quinone oxidoreductase
hypothetical protein
acetyl-CoA synthetase
hypothetical protein
hypothetical protein
choline dehydrogenase
betaine aldehyde dehydrogenase
hypothetical protein
hypothetical protein
hypothetical protein
choline transporter
hypothetical protein
hypothetical protein
hypothetical protein
anaerobic ribonucleoside triphosphate reductase
citrate transporter
hypothetical protein
precorrin-2 dehydrogenase
sulfite reductase %28NADPH%29 flavoprotein subunit alpha
hypothetical protein
hypothetical protein
hypothetical protein
permease domain-containing protein
ABC transporter ATP-binding protein
nisin susceptibility-associated sensor histidine kinase
nisin susceptibility-associated DNA-binding response regulator
hypothetical protein
alkaline phosphatase III
hypothetical protein
hypothetical protein
tributyrin esterase
clumping factor B
hypothetical protein
carbamate kinase
arginine%2Fornithine antiporter
ornithine carbamoyltransferase
arginine deiminase
hypothetical protein

Sheet1

zinc metalloproteinase aureolysin
immunodominant antigen B
hypothetical protein
hypothetical protein
PTS system fructose-specific transporter subunit IIABC
mannose-6-phosphate isomerase
phage infection protein
N-acetylmuramoyl-L-alanine amidase
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
preprotein translocase subunit SecA
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
preprotein translocase subunit SecY
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
hypothetical protein
methionine sulfoxide reductase A
hypothetical protein
capsular polysaccharide biosynthesis protein Cap5C
capsular polysaccharide biosynthesis protein Cap5B
capsular polysaccharide biosynthesis protein CapA
ica operon transcriptional regulator IcaR
N-glycosyltransferase
hypothetical protein
intercellular adhesion protein B
intercellular adhesion protein C
lipase
multifunctional imidazole glycerol phosphate synthase subunit%2Fphosphoribosyl-AMP cyclohydrolase%2Fpt
1-%285-phosphoribosyl%29-5-%5B%285-phosphoribosylamino%29methylideneamino%5D imidazole-4-carbo
imidazole glycerol phosphate synthase subunit HisH
imidazoleglycerol-phosphate dehydratase
histidinol-phosphate aminotransferase
histidinol dehydrogenase
ATP phosphoribosyltransferase catalytic subunit
ATP phosphoribosyltransferase regulatory subunit
hypothetical protein
hypothetical protein
hypothetical protein
ABC transporter ATP-binding protein
hypothetical protein
hypothetical protein
hypothetical protein
lactonase Drp35
hypothetical protein
pyrrolidone-carboxylate peptidase
hypothetical protein
hypothetical protein
hypothetical protein
