ABSTRACT

Design/methodology/approach – The research approach is deductive in nature, focusing on finding out the most critical factors through literature review and reinforcing the factors through a 5- point Likert scale survey questionnaire. The responses received were tested for reliability before being run through Machine Learning algorithms to determine the most influencing OSC factors within the Nigerian Construction Industry (NCI).

Purpose –Several factors influence OSC adoption, but extant literature did not articulate the dominant barriers or drivers influencing adoption. Therefore, this research has not only ventured into analyzing the core influencing factors but has also employed one of the best-known predictive means, Machine Learning, to identify the most influencing OSC adoption factors.

Findings – The research outcome identifies seven (7) best-performing algorithms for predicting OSC adoption: Decision Tree, Random Forest, K-Nearest Neighbour, Extra-Trees, AdaBoost, Support Vector Machine, and Artificial Neural Network. It also reported finance, awareness, use of Building Information Modeling (BIM), and belief in OSC as the main influencing factors.

Research Limitation/Implication – Data were primarily collected among the NCI professionals/workers and the whole exercise was Nigeria region-based. The research outcome, however, provides a foundation for OSC adoption potential within Nigeria, Africa and beyond.

Practical implications – The research concluded that with detailed attention paid to the identified factors, OSC usage could find its footing in Nigeria and, consequently, Africa. The models can also serve as a template for other regions where OSC adoption is being considered.

Originality/value – The research establishes the most effective algorithms for the prediction of OSC adoption possibilities as well as critical influencing factors to successfully adopting OSC within the NCI as a means to surmount its housing shortage.

Keywords – Construction, Construction industry, Nigeria, Offsite Construction, Machine Learning

Paper type – Research paper

1.0 INTRODUCTION

Nigeria has been battling housing challenges for a long while (Kolo et al., 2014). Listed as the 7th most populous nation on earth and 1st in Africa with over 213 million inhabitants (UN, 2021), Nigeria has a deficit of over 17 million houses in its major cities (Rahimian et al., 2017). The cities have become overcrowded owing to an insufficient amount of shelter to accommodate their sprawling populations. Despite the slums being created around the cities' suburbs, migration to most urban areas of the nation, estimated at 5.5%, increases daily (Makinde, 2014). The government has schemed different approaches to resolving the housing issues at the federal and state levels but has recorded little or no success.

Public-Private-Partnerships have equally been tried, but it has yielded insignificant progress on housing amelioration. (Okonjo-Iweala, 2014) noted that with Nigeria outputting less than 100,000 units of houses annually, over 700,000 units of homes would be required to offset the housing deficit in about four major cities alone. Scholars

1
2
3 have reported in a few articles on the housing challenge being faced in Nigeria as
4
5 attributable to the approach being employed by the different stakeholders trying to
6
7 resolve the deficits, while suggesting the propensity of OSC being a out. (Dunmade &
8
9 Fayomi, 2018; Kolo et al., 2014; Njoku & Adegboye, 2015; Rahimian et al., 2017; Usman,
10
11 2019; Windapo & Rotimi, 2012). In other instances, (Rahimian et al., 2017) reported on
12
13 causal factors influencing OSC adoption, (Dixon-Ogbechi and Adebayo, 2020) examined
14
15 important factors that determine developers' choice of prefab building type and (Kolo et
16
17 al., 2014) examined housing challenges and how Offsite Construction can salvage the
18
19 deteriorating situation.
20
21
22
23

24 Majority of the houses being constructed in Nigeria today employ the traditional or
25
26 conventional construction method, using brick and mortar with other aggregates
27
28 (Adeagbo and Anigbogu, 2020). This construction method has been in use for centuries.
29
30 However few projects have sought alternatives to improve construction in Nigeria. The
31
32 traditional construction method is very slow, less safe, expensive, cumbersome, results
33
34 in cost over-run and is easily affected by inclement weather and other external factors
35
36 (Ajayi et al., 2019; Arif et al., 2017; Blismas & Wakefield, 2009; Gan et al., 2018;
37
38 Razkenari et al., 2020; Schoenborn, 2012). It generates a lot of waste and does not
39
40 promote sustainability (Razkenari et al., 2020).
41
42
43
44

45 The developed nations of the world and a few developing nations today use other forms
46
47 of construction to address their housing challenges (Goodier and Gibb, 2007; Nadim &
48
49 Goulding, 2010; Razkenari et al., 2020; Salman et al., 2013; Waris et al., 2014). This
50
51 form of construction method is fast, safer, environmentally friendly, promotes
52
53 sustainability, has better quality and strength, and has been evaluated to be more
54
55
56
57
58
59
60

1
2
3 economical. This new construction approach has evolved over the years, bearing
4
5 different nomenclatures. Some of the names by which the methodology is known are
6
7 Prefabricated Building, Pod Construction, Modular Construction, Modular Integrated
8
9 Construction, Industrial Building System, Modern Method of Construction, Offsite
10
11 Construction and so on (Salman et al., 2013; Wuni and Shen, 2020; Salman et al.,
12
13 2013). Some concepts and principles for enhancing the production of OSC products
14
15 include Design for Manufacture (DfMA), Design for Assembly (DfA), Design for
16
17 Manufacture (DfM), Design for Excellence (DfX) etc. These concepts have been known
18
19 to help in standardizing OSC as seen in manufacturing industry (Zhang, 2019; Dixon-
20
21 Ogbechi and Adebayo, 2020; Gusmao Brissi et al., 2021). For this article, Offsite
22
23 Construction shall be used to aggregate the other forms of modern construction types
24
25 differing from the traditional method of construction, which is also referred to as the
26
27 conventional method of construction.
28
29
30
31

32
33 Therefore, Offsite construction (OSC) is constructing a complete house by assembling
34
35 the different elements or components that would make up a whole building. The
36
37 members are manufactured in a controlled environment on or off site before being
38
39 transported to the point of use through coordinated logistics for assemblage (Adeagbo
40
41 and Anigbogu, 2020).
42
43
44

45 Offsite Construction (OSC) is rapidly becoming the new normal in the Architecture,
46
47 Engineering, Construction and Operation (AECO) world, recording more significant
48
49 popularity in the past 20 years (Wang et al., 2020). Its numerous advantages, such as
50
51 time-saving (Smith & Quale, 2017), quick on-site assemblage (Gusmao Brissi et al.,
52
53 2021; O'Neill & Organ, 2016), eco-friendliness (Moradibistouni et al., 2019; Salman et
54
55
56
57
58
59
60

1
2
3 al., 2013), safety (Abueisheh et al., 2020; Babalola et al., 2019), controlled and quality
4 production (Abanda et al., 2017; Tam et al., 2007), ease of handling (Ramos & Lorini,
5 2013), waste reduction properties (Ajayi et al., 2019; Osmani, 2012) etc., has made it
6 more endearing to construction stakeholders. With countries like the United Kingdom,
7 China, USA, Germany, Malaysia, Hon-Kong, Australia, Netherlands, Sweden, Finland
8 (Badir et al., 2002; Li et al., 2014), and so on vastly employing OSC in most of their
9 construction works, OSC usage around the globe is projected to increase in the coming
10 years. However, despite the numerous attributed advantages of OSC, it has not yet fit
11 into the contextual construction framework of many developing and under-developed
12 countries. There are still factors in the form of barriers that have to be surmounted for
13 OSC to gain the global popularity it is aiming for, especially in developing countries like
14 Nigeria.

15
16
17 Thus, this paper aims to establish the critical factors affecting Offsite Construction
18 adoption in Nigeria and predict how the established factors influence OSC success level.

19 It proposes achieving this aim through the following objectives:

- 20 1. To establish the driving and inhibiting factors of OSC in countries where it has
21 adopted through literature studies.
- 22 2. To use the established factors through the literature review as independent
23 variables and use iteration through multi-layer feature selection algorithm to uncover
24 the most applicable influencing factors of OSC adoption in Nigeria.
- 25 3. To predict the dependent variable, using Machine Learning Algorithm, if OSC
26 would thrive in Nigeria in the coming years.

27 **2.0 LITERATURE REVIEW**

1
2
3 Some studies have examined OSC adoption among some countries in America, Africa
4 and Europe, including the UK. Scholars have referenced UK as the yardstick for
5 measuring adoption in a sizable number of articles about the country that seems to have
6 the most used OSC in the time past when OSC first boomed. A large part of OSC works
7 today is of East origin, and China/Hong Kong focus to be precise where OSC seem to
8 have been more adopted in recent times (Badir et al., 2002; Gan et al., 2018; Jiang et al.,
9 2020; Li et al., 2014; Mao et al., 2018; Wu et al., 2019). Other nations highlighted to
10 have adopted OSC and documented its use in their construction methods are the
11 Netherlands, Denmark, Finland, Germany and Canada (Lessing and Brege, 2015). It was
12 observed in the articles that cultural and regional differences account for differing
13 drivers and barriers (Gan et al., 2018). The scholarly articles have identified probable
14 adoption influencing factors. However, the ones with analytical tools are reported.
15 Below (See Table 1) is an extract of the works done, the location in focus and the factors
16 found out regarding OSC adoption.

40
41 Some scholars have worked on Offsite Construction and its adoption in various forms
42 (Ajayi et al., 2019; Arif et al., 2017; Salman et al., 2013; S. Sepasgozar & Davis, 2018).
43 Their research have outlined various barriers and drivers influencing its use in this
44 modern age (Arif et al., 2017; Blismas and Wakefield, 2009; Gan et al., 2018; Gusmao
45 Brissi et al., 2021; Rahimian et al., 2017; Zhai et al., 2014). Some have dealt with the
46 advantages of OSC in a bid to drive its adoption, while others have looked at the
47 disadvantages as a ground to disregard its adoption. Scholars have identified some

critical factors applicable to different locations around the globe (Salman et al., 2013; Wuni and Shen, 2020) and others (Adeagbo and Anigbogu, 2020; Dixon-Ogbechi and Adebayo, 2020; Makinde, 2014) to Nigeria, but none has outlined the most critical factors that can pave way for a wider adoption of OSC within the Nigerian context using Machine Learning algorithms. Some notable factors include, but are not limited to, government policies, incentives and intervention, social and environmental factors, technical and technological factors, cost and economic factors, logistics, skills, etc.

39 factors were deduced from the various literature review and were used to develop a questionnaire survey. The factors, which are examined under related impacts, are government policies on production, government policies on importation, cultural heritage factors about OSC (i.e., being used to a style of building as a result of living in an environment/location, e.g., belief in the use of thatched roof on a round building in northern Nigeria.), historical factors (failure of OSC in places where it was used), belief system (religious beliefs on building type and style), environmental factors (weather, climate, etc.). In addition, factors such as designers' attitudes, construction site managers, construction site workers, end-users/ building occupiers, client/ investor desire to use OSC for construction were placed under attitudes. Awareness of OSC by designers, awareness of OSC by construction managers, awareness of OSC by construction site workers, awareness of OSC by end-users/ building occupiers, awareness of OSC by clients, awareness of OSC by government, falls under awareness while level of accessibility to loans, accessibility to favorable exchange rate come under funding. Level of availability of bespoke OSC manufacturing company, availability of new or amended form of construction contracts that focus on OSC, availability of

1
2
3 contract documentation relating to OSC come under contract documentations, supply
4 chain integration for OSC, Supply chain management for OSC. Technological
5 Advancement (OSC Installation technique), come under logistics. Level of availability of
6 in-house OSC design expertise for manufacturing companies, level of in-house OSC
7 building expertise for construction companies, level of availability of skilled personnel at
8 Design Companies, level of availability of skilled building personnel on construction site
9 come under OSC expertise, Construction knowledge of OSC among Construction
10 professional bodies in Nigeria, level of training/education in Nigerian universities on
11 OSC designs, level of guidance of BIM implementation and utilization on OSC fall under
12 skill development. Cost of OSC Components and Cost of OSC Installation were also
13 looked at.

24
25
26
27
28

29 Predictive scholarly works have also been carried out within the construction sector.
30 (Alaka et al., 2019, 2018) predicted the insolvency of small construction firms using ML
31 models, (Olu-Ajayi et al., 2021; Robinson et al., 2017) predicted building energy
32 consumption. (Alozn & Galadari, 2015; Arditi & Pulket, 2005) used ML to predict the
33 outcome of litigation issues within the construction industry; predicted construction
34 delays using ML algorithm. (Egwim et al., 2021) used ML to predict accident severity
35 levels on construction sites. However, to the best of available knowledge, at the time of
36 this research, no researcher has embarked on using ML algorithms to examine the key
37 factors responsible for the low level of adoption of OSC within the construction industry.
38

5
6

7
8
9 In a bid to make living better for humans, technology advances through increased
10 knowledge and innovation (Fernandes et al., 2006). Products are designed,
11 manufactured, and they evolve with time and usage. During the lifecycle of an industry
12 or a product, transformational evolution to meet rampant demand and environmental
13 changes become unavoidable (Roberts et al., 2021). The construction industry is not
14 averted to this imminent transformational evolution. With a great demand to have an
15 improved housing systems for the society, the innovation of Offsite Construction should
16 be diffused to many nations' construction industry because it is fast, easily adaptable to
17 site, relatively safer when compared with traditional methods and delay causes can be
18 easily identified and mitigated. It is ecologically friendly and sustainable, lightweight
19 and does not require complex engineering technicalities. (Daniela & Tom' a's, 2016.;;
20 Wisdom et al., 2014).

33
34
35

36 The theoretical approach to this study follows the general theories of adopting
37 technological innovation in industries (Munir, 2003; Ragozzino, 2006) as it best applies
38 to construction and, more precisely, to adopting improved innovation in the
39 construction industry. The theories considered are:
40
41
42
43
44

- 45 1. Roger's Innovation Diffusion Theory (DTI)
- 46 2. Technology Adoption Models (TAM)
- 47 3. The Concerns-Based Adoption Theory (C-BAM)
- 48 4. The United Theory of Acceptance of Use of Technology (UTAST)
- 49
- 50
- 51
- 52
- 53
- 54
- 55
- 56
- 57
- 58
- 59
- 60

1
2
3 The Concerns-Based Adoption Theory (C-BAM) shall therefore be adopted for this
4 research because it considers Innovation Configuration, Stages of Concern and Level of
5 use. More importantly, it gives room for both feedback from adopters and a means of
6 follow-up on them.
7
8
9
10

11
12 *Figure 1: Concern Based Adoption Theory (see journal table)*

13
14 *Source: <https://sedl.org/cbam/d>*

15
16
17 The Innovation Configuration creates a roadmap for team members by which goals
18 would be achieved with high-quality executions (Chanda and Bardhan, 2008). The
19 Stages of Concern address how team leads identify the state of members' minds
20 regarding the newly introduced initiative. The process involves questioning, interviews
21 and feedbacks. Based on the information gathered, the team lead can take necessary
22 action to address each team member's challenge. The Level of Use help identify the way
23 team members are adapting to the use of the new initiative, the challenges they are
24 having and how the issues are being resolved. Finally, the team lead observes the level of
25 use, from non-usage, low usage to advanced usage. This process helps the team lead
26 draw conclusions and measure the success of the newly introduced innovation (Garry,
27 2010; Hord et al., 2006; Shirley M. Hord et al., 2013; S. M. Hord et al., 2013).
28
29
30
31
32
33
34
35
36
37
38
39
40

41
42 With the topic under study focusing on improved innovation, awareness, attitude,
43 adoption, acceptance, usefulness, ease of use and diffusion of use, this theory addresses
44 the issues relating to why OSC is yet to be adopted as a viable construction method in
45 Nigeria (Lai, 2017; Sepasgozar and Davis, 2018; Straub, 2009)
46
47
48
49

50
51 With respect to Offsite Construction adoption within the NCI, this research consolidates
52 on some earlier mentioned works within the Nigerian and global context in providing
53 relevant information on how OSC can be diffused within the NCI for wider adoption. It
54
55
56
57
58
59
60

1
2
3 also discussed the measures by which the level of satisfaction by users can be appraised
4
5 or evaluated while not leaving out parameters by which this diffusion can be assessed.
6

7
8 Considering the prefab building constructed in Nigeria e.g. Dolphin Estate, tertiary
9
10 institution buildings like University of Lagos, Obafemi Awolowo University etc., it can
11
12 be said that NCI falls into the league of not too late adopters of the OSC construction
13
14 method and probably early adopters in Africa (Dixon-Ogbechi and Adebayo, 2020).
15
16 However, there is still a long way to go in improving the knowledge, awareness,
17
18 appraising and diffusing the use of OSC within the NCI.
19
20
21

22 **3.0 MACHINE LEARNING APPROACH**

23
24
25
26 Machine Learning (ML) is an arm of Artificial Intelligence (AI) focused on analyzing
27
28 data from the sample data set provided, developing models from trained data set and
29
30 predicting outcomes from the testing data set. It mimics the way human beings learn,
31
32 develop character and operates habitually (Sumana, 2021). It employs algorithms and
33
34 statistical models to learn from the training data set. Machine Learning can be used in
35
36 supervised training, unsupervised training and reinforcement training data sets (Egwim
37
38 et al., 2021) One of the major objectives of ML is the use of trained data set to identify a
39
40 typical pattern or trend in the data set and test such patterns to predict a probable
41
42 outcome. It is proposed to have a lot of applications in the future owing to its ability to
43
44 identify patterns earlier unknown (H. A. Alaka et al., 2016; Xie et al., 2020).
45
46 Interestingly, ML does not need to be outrightly programmed like other computational
47
48 approaches to identify or predict outcomes. There are libraries of programmes in ML
49
50 that provide the required algorithms, e.g., Scikit Learn, Numpy, Pandas, Matplotlib.
51
52
53
54
55
56
57
58
59
60

1
2
3 Some features that put Machine Learning ahead of other analytical tools are its ability to
4 identify patterns or rhythms earlier unknown in data, the variables options for
5 associating two or more factors and categorization of factors by similarities. Moreover, it
6 can predict outcomes based on specific criteria, group objects or activities based on their
7 history, image recognition and classification due to historical observations, and
8 structure unexplored data (clustering). Some Machine Learning algorithms include
9 Logistic Regression, Random Forest Algorithm, Decision Tree, Linear Discriminant
10 Algorithm, Naïve Bayes, Support Vector Machine, K-Mean Clustering, Artificial Neural
11 Network and Classification and Regression Tree algorithm among others.
12
13
14
15
16
17
18
19
20
21
22
23

24 Machine Learning has been very impactful in automobiles, robotics, language
25 processing, health and finance. More recently, the Machine Learning approach has been
26 tried in some research works in construction, and they have shown positive outcomes.
27 Such ML research work include Construction Site Safety Indicators (Poh, et al., 2018),
28 Construction Injury Prediction (Tixier et al., 2016), Building life-span prediction (Ji et
29 al., 2021), Building comfortability prediction (Park & Park, 2021), Bankruptcy
30 Prediction of Construction Businesses (Alaka et al., 2019), Construction Activity
31 Recognition Using Sensors and Machine Learning (Akhavian and Behzadan, 2015).
32 With these positive outcomes, Machine Learning is gradually finding its footing within
33 the construction industry, giving adoption a bright hope using Machine Learning.
34
35
36
37
38
39
40
41
42
43
44
45
46

47 Machine Learning, at the time being, is the one of the best-known predictive and
48 analytical tool that exists (Addie, 2019; Johnson, 2020). It is well known for its ability to
49 predict, forecast and in data exploration, including correlation. Various studies in the
50 past have employed various methods in analyzing the adoption of Offsite Construction.
51
52
53
54
55
56
57
58
59
60

1
2
3 Such analytical tool includes Nvivo and Analytics Hierarchy Process- AHP Analysis
4 (Sepasgozar and Davis, 2018), Big Data Analytics tool (Alaka et al., 2019), Capability,
5
6 Opportunity, Motivation-Behaviour (COM-B) System. See Table 1.
7
8
9

10
11 Even though Machine Learning has been known to be the best in analyzing, determining
12 and predicting the most critical factors, no known article has employed the use of multi-
13 variate analysis and Machine Learning in addressing the issue of OSC adoption. The
14 closest to OSC adoption prediction is the *Evaluation of Quality Defects* done by (T. Yu
15 et al., 2019) using the Bayesian Network-Based Model (*See Table 1*). Therefore, this
16 research work would take advantage of the 'expert' analytical tool in exploring the
17 factors that can foster OSC adoption within the Nigerian construction industry.

27

28 **4.0 METHODOLOGY**

29
30

31 In line with the objectives of this article, a literature review to deduce the prevailing OSC
32 factors globally was carried out. These deduced factors were developed into a
33 questionnaire used to survey the adoption of OSC within the NCI. This approach to
34 research is deductive- taking out facts from extant literature to measure how applicable
35 those facts are to the objectives of a research (Creswell et al., 2003; Wacker, 1998). It
36 employs survey question through factors deduced from literature survey measure the
37 said applicability. The paradigm considered was positivism because it does relate well
38 with quantitative investigations and predictions. (Creswell et al., 2003; Onwuegbuzie
39 and Hitchcock, 2015; Wacker, 1998)
40
41
42
43
44
45
46
47
48
49
50
51

52
53 This work is researched by utilizing prediction capabilities for OSC adoption in Nigeria.
54 Data was collected through questionnaires from industry players within the Nigerian
55
56
57

1
2
3 construction industry (Brannen & Moss, 2012). First, literature relating to OSC and its
4
5 adoption was sourced through scholarly search engines like Google Scholar and Scopus
6
7 (Almalki, 2016; O'Neill & Organ, 2016). The literature survey used key search words and
8
9 phrases such as adoption, Modular Construction, Offsite Construction and Prefab
10
11 Constructions, and key authors' names. Specifically, research published on the subject
12
13 between 2000 to 2021 were considered. A review of these papers informed the potential
14
15 critical factors responsible for low Offsite Construction adoption level in Nigeria.
16
17

18
19 The factors that evolved among various vital players of the construction industry
20
21 towards OSC adoption from the literature studies revolve around policies affecting
22
23 production and importation, cultural heritage and beliefs and attitudinal reactions
24
25 (Malhotra, 1999; O'Connor et al., 1992). Also observed were accessibility to funds, belief
26
27 in the functional properties of OSC component make-up, ease of workability and
28
29 awareness. In addition, the factors pin-pointed some reactionary displays of interest in
30
31 adopting OSC as a construction methodology. These factors observed were used to
32
33 develop a set questionnaire piloted through simple random strategy criteria with seven
34
35 carefully selected participants (Creswell, 2003; Gregar, 2014.). Five of these participants
36
37 have construction background and have at a time or the other designed or
38
39 recommended OffSite Construction methodology for use. The other two were non-
40
41 subject experts who shared the view of end users away from construction personnel
42
43 perspectives which earlier works have omitted (Döringer, 2021). Some observations
44
45 such as tenses restructuring, spelling mistakes, regrouping of factors under related
46
47 headings were made on the questionnaire, others were debated, and necessary
48
49 corrections were made.
50
51
52
53
54
55
56
57
58
59
60

1
2
3 The questionnaire was developed in Microsoft form. Using purposeful sampling
4 technique (Palinkas et al., 2015), the form link was administered to relevant key players
5 in the NCI through e-mails and social media platforms for responses. The targeted
6 responders were architects, civil/structural engineers, electrical engineers, mechanical
7 engineers, building engineers, town/urban planners, quantity surveyors, contractors,
8 academics, real estate investors, and developers. They were considered because they are
9 thought to be actively involved in everyday construction processes in the country and
10 are involved in making and taking decisions bordering around the choice of building
11 materials, technology and methodology to be used on projects. Over 300 forms were
12 sent out. Two hundred twenty-four (224) responses were received, indicating a 74.67%
13 response. Sixty-nine (69) responses were void, leaving one hundred fifty-five (155)
14 responses to analyze. The valid forms account for 69.2% valid response. The average
15 response duration was 11.45 minutes.
16

21
22
23
24
25
26
27
28
29
30
31

32 The various factors extracted from the literature were put under headings such as
33 policies, design, attitudes, BIM impacts, etc. based on relational effects. These factors
34 (variables) were tagged VR1, VR2...VR39 for nomenclature purpose and easy
35 identification during analysis. *See Table 2 below.* VR1...VR38 makes up the independent
36 variables while VR39 is the dependent variable.
37
38
39
40
41
42
43
44

45 *Table 2: Factors Deduced from Questionnaire with variable tag (See journal tables)*
46

47 A couple of missing data was observed in excel when the responses were exported. The
48 missing data were dealt with using the most occurring figure (mode implication on
49 missing data).
50
51
52
53
54

55 **5.0 ANALYSIS AND RESULTS**

56
57
58
59
60

5.1 Reliability test result

A Cronbach Alpha test was conducted on the responses received from questionnaire survey for the 39 variables examined. The closer a Cronbach Alpha index is to 1, the more reliable the data indicates a strong reliability (Egwim et al., 2021; Wuni and Shen, 2020a). A rule of thumb says a 0.7 Cronbach index shows consistency within the survey responses and passes a generally acceptable scientific threshold required for reliability test. A 0.8 outcome is considered a good internal correlation and 0.9 an excellent reliability result (Bhatnagar et al., 2014). The reliability result of the variables indicated 0.782 and which is thus considered a good internal consistency of the variables.

5.2 Data pre-processing

After cleaning and normalization, the data were split into test and train data set (60:40) owing to its small size (Balogun et al., 2021; Joseph, 2022). When a univariate analysis was run with the variable results, the results did not bring about good predictive models. Clearly, not all the features examined are important as most variables do not contribute meaningfully to the adoption possibilities. If they do, they all would have shown a good predictive model. This reason may be due to the many variables examined together. This created potentials for noise and multicollinearity. Some of these variables are therefore causing noise within the models examined. It shows they do not have a good relationship with the adoption prediction. Below (*Figure 2*) is a correlation matrix that show which variables correlate fairly with each other.

Figure 2: Correlation Matrix of Variables (see journal figures)

1
2
3 As can be deduced from the figure above, only a few variables correlated well on a single
4 correlation. On a scale of 1, the bests only correlate at 0.7. the variables that fared well
5 are VR27 and VR28; VR24 and VR25; VR21 and VR22; VR15 and VR16 and VR13 and
6 VR14. A well-known limitation of single correlation is that it takes out some crucial
7 features with no high correlation with the dependent variable, which is to know if OSC
8 would thrive within the Nigerian construction industry. But when a multi-variate
9 correlation is carried out, where the variables are taken together with another variable,
10 that variable becomes important.
11
12
13
14
15
16
17
18
19
20
21

22 **5.3 Feature engineering**

23
24 However, since the research aims to identify the critical factors influencing the adoption
25 possibilities, and in line with objective 2, a further analysis was run with feature
26 selection. This multi-variate process is better than a single correlation process because it
27 identifies the variable of casualty when the value of the independent variable changes as
28 result of the relation that exist between them (Mayuresh, 2021; Sandilands, 2014). As
29 can be deduced from the initial analysis, the correlation process shows a poor
30 relationship between the variables. Therefore, there is a need to look beyond the single
31 correlation matrix as single correlation analysis (a univariate analysis) takes out some
32 important feature with no high correlation with the dependent variable- the adoption
33 level sought. However, when taken together with another feature, that feature becomes
34 very important and requires a multi-variate analysis. Machine Learning would be
35 employed to carry out the required multi-variate analysis since it is known to have some
36 of the best known performing predictive algorithms.
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54

55 **5.4 Feature selection**

1
2
3 A predictive model was created with the variables through feature selection and
4
5 Machine Learning Algorithms to identify which variant is the most important for
6
7 adoption. Some of the Machine Learning algorithms used in the uni-variant analysis are
8
9 Decision Tree, Random Forest, XGBRegressor, SGDRegressor, RidgeCV, LarsCV,
10
11 ElasticNetCV, Extra-Trees (Extremely Randomized Trees),
12
13 GussianProcessingRegressor, Linear Regression, PoissonRegressor, AdaBoost, K-
14
15 Nearest Neighbours, Support Vector Machine, Artificial Neural Network, Support
16
17 Vector Regressor, Bagging Regressor, Bayesian Ridge ElasticNet among others. For the
18
19 multi-variant analysis, Decision Tree, Random Forest, Extra-Trees (Extremely
20
21 Randomized Trees), AdaBoost, K-Nearest Neighbours, Support Vector Machine and
22
23 Artificial Neural Network were used. Each of the multi-variant models performed at the
24
25 least twice better than the uni-variant model. The model, again, performs relatively
26
27 better with feature selection. Below are the outcomes with and without feature selection.
28
29 This shows that these models, from a multi-variant perspective, are the most important.
30
31
32
33
34
35

36 *Table 3: Machine Learning Model Without Feature Selection (See journal tables)*

37
38
39 *Figure 3: Entire ROC AUC (Without Feature Selection); see journal figures*

40
41
42 To resolve the shortcomings of the model outcomes, feature engineering was carried out
43
44 on the models using Pearson Correlation. Pearson correlation, also known as Pearson
45
46 Product Moment Correlation (PPMC), is a measure of statistical correlation that use the
47
48 scale of -1 to +1 to define the linear correlation between a dependent variable and the
49
50 independent variables (Stephanie, 2021). Thus, an outcome closer to +1 shows a strong
51
52 correlation to the dependent variable, a zero outcome shows no correlation, while a
53
54
55
56
57
58
59
60

1
2
3 closer figure to -1 shows a negative correlation (Diah et al., 2020). Below is the result of
4 the feature engineering done.
5
6

7
8 *Table 4: Machine Learning Model With Feature Selection. (See journal tables)*
9

10
11 *Figure 4: Entire ROC AUC (With Feature Selection); see journal table*
12

13
14 *Figure 5: Feature selection using Pearson correlation (see journal table)*
15

16
17 *Table 5: Most Important Factors from Feature Selection (See journal tables)*
18

19
20 On completing the multi-variate analysis, about twelve (12) were most correlated.
21 (Variables within the very dark green region, ≥ 2.0). Consideration was given to the
22 four variables with 0.19 as minor underlining factors due to nearness to 0.2. Of the
23 twelve, the best seven (7) were used to develop the predictive models and showed much
24 better outcomes. Therefore, from a multi-variate perspective, the seven (7) variables are
25 the most important. These factors seem not to be so important on the univariate
26 analysis, but they become very important for prediction on a multi-variate, where they
27 link with other variables.
28
29
30
31
32
33
34
35
36
37

38 **6.0 DISCUSSION**

39
40
41 In line with the second and third objectives of this article, feature selection was carried
42 out. A comparison between the univariate and multivariate analysis shows that the
43 factors obtained through feature selection have stronger influencing factor, as reported
44 in *Figure 5* and *Table 5*. The prediction show that the feature selection factors perform
45 much better than all the factors obtained from the literature review even though they are
46 small in number. The feature selection factors show better accuracy. The 'not too
47 critical' factors were generating noise within the model and thus, excluded when
48
49
50
51
52
53
54
55
56
57

1
2
3 subjected to feature selection. The most applicable influencing factors are thus,
4
5 discussed below.
6
7

8 **6.1 Accessibility to loans**

9

10
11 Building and construction works are highly capital-intensive ventures (Arif et al., 2017;
12
13 Bryson, 2019; Fellows & Liu, 2015; Gusmao Brissi et al., 2021; Hendriks & Stokmans,
14
15 2020; Nanyam et al., 2017; Njoku & Adegboye, 2015; Pan et al., 2007; Rahimian et al.,
16
17 2017a; Tan et al., 2020; Tanyanyiwa & Kanyepi, 2020; Zhai et al., 2014). Primary to the
18
19 success of a construction project is the availability of funds (Hossain et al., 2020; Li et
20
21 al., 2014). From the land purchase cost to building materials costs and the payment of
22
23 professional and site workers, enormous amounts of funds are required to complete a
24
25 building project (Adeagbo and Oyemogum, 2013; Makinde, 2014).
26
27
28

29
30 (Okonjo-Iweala, 2014) highlighted developed countries as having muscular financing
31
32 bodies for building construction industries. For example, the Mortgage bank to GDP
33
34 ratio is US, UK, Malaysia, Honk-Kong, Europe are 77%, 80%, 32%, 50%, 50%
35
36 respectively unlike their counterpart Africa nations like Botswana, Ghana and Nigeria
37
38 where the ratios ridiculously stand at 2%, 2% and 0.5% respectively. Further to the
39
40 argument is that only about 12,000 contributors have been supported by mortgage
41
42 saving out of over 3.8million eligible contributors (Okonjo-Iweala, 2014).
43
44
45

46
47 To employ OSC, which is known to require massive capital take-off, accessibility of
48
49 loans, or other means of funding, will be a key driver in establishing OSC as a viable
50
51 construction method. Beyond just making funds available for construction, the
52
53 mortgage banks should be re-institutionalized for their proper purpose, the credit
54
55
56
57
58
59
60

1
2
3 should be as seamless as possible, and both the repayment plans and interest rates
4
5 should be flexible
6
7

8 **6.2 Awareness of OSC (By Government, Construction Managers and** 9 10 **Designers)**

11
12
13 The number of projects carried out in Nigeria using OSC is **scanty**. However, the
14 massive construction works on-going in many parts of the Nigerian states show the level
15 of awareness of OSC is still low as most of the projects are still being executed via the
16 conventional construction method. This indicates that major construction industry
17 players are not aware of OSC yet or have not examined its huge benefits if employed as
18 their construction method (Barton and Wilson, 2021; Gusmao Brissi et al., 2021). The
19 designers and project managers are established chain-links in the construction industry
20 cycle (Dunmade and Fayomi, 2018). They are the first point of call for clients. The
21 adoption success of OSC rests on the awareness, knowledge and specification of OSC as
22 a viable option for construction (Liao, 1996; O'Connor et al., 1992). The government
23 plays a crucial role in introducing any product into its citizens' market as the gatekeeper
24 (Badir et al., 2002; Hashemi and Hadjri, 2014; Nadim and Goulding, 2010; Wong and
25 Yip, 2004). Their policies and laws determine the success of any innovation, which
26 depends on how much knowledge they have about the product (Waris et al., 2014).
27 Therefore, there is a need to herald comprehensive enlightenment and crusade for OSC
28 usage and its benefits within the Nigerian construction industry.
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49

50 **6.3 Level of guidance of BIM, implementation and utilization on OSC**

51
52
53 The introduction of BIM to the construction industry is relatively recent and has played
54 a significant role in reshaping the approach to construction design and management in a
55
56
57

1
2
3 short time (Abanda et al., 2017). It is just getting institutionalized in the construction
4
5 practice of most developed countries where OSC has thrived (Chanda and Bardhan,
6
7 2008; Liao, 1996). Studies show that not many countries have merged OSC design
8
9 requirements in their BIM applications (Charef et al., 2019; Di Giuda et al., 2019). Revit,
10
11 the most conversant BIM software for designers, recently developed a plug-in for DfMA
12
13 to promote OSC in the UK construction industry in promoting OSC usage among
14
15 designers. This plug-in is yet to be made public for all as of this writing time. Other BIM
16
17 applications need to look toward the OSC-BIM merger (Wang et al., 2020). The more
18
19 knowledge and tool on OSC available for designers, who are the first port of call in the
20
21 construction industry, the better it would be for OSC to thrive because they can easily
22
23 recommend OSC in their specifications.
24
25
26
27
28

29 With the outcome of this research indicating BIM guidance, implementation and
30
31 utilization as a significant factor that would drive OSC adoption in Nigeria, the Nigerian
32
33 construction industry would need to introduce and institutionalize BIM usage in its
34
35 construction workbook.
36
37

38 ***6.4 Designers' attitude (i.e., Architects, Civil/Structural, Building, Mech. 39 40 41 and Elect. Engrs.)***

42
43 Some scholars have opined that the newness of the OSC construction method has
44
45 steered an attitudinal reaction from key players in the industry, including the design
46
47 professionals (Adeagbo and Oyemogum, 2013; Kolo et al., 2014; Makinde, 2014;
48
49 Rahimian et al., 2017a). However, a large percentage are trained in the conventional
50
51 method of construction and have passed same knowledge down the line over the years.
52
53
54 Having to retrain in designing **for manufacture and installation in** construction is
55
56
57
58
59
60

1
2
3 strenuous and demanding on their mean time (Wang et al., 2020). Therefore, there is a
4
5 need to softly introduce OSC through continuous development programmes, retraining
6
7 courses, seminars and expos where the important role of designers in this new
8
9 emergence would be stressed (Tam et al., 2007).
10
11

12 13 **6.5 Future of OSC in Africa and Nigeria**

14
15

16 With not just a housing deficiency of almost 20 million (prorated from the 17 million
17
18 deficit of 2014 based on 2.5% annual population growth (Adeagbo and Anigbogu, 2020)
19
20 and 5.5% migration to urban centres (Makinde, 2014)); but also a housing need with an
21
22 estimated market prorated at \$326billion (133.761 quadrillion by today's conversion)
23
24 (Makinde, 2014), the future of OSC looks bright if there is maximum cooperation
25
26 between the government and the policies enacted, and the construction industry key
27
28 players. The Nigerian and African housing markets will be a good direction to look into
29
30 for investors.
31
32

33
34 Relatively, similar outcomes were observed by some earlier researchers on barriers to
35
36 OSC adoption in other countries. In the UK, for example, (Ajayi and Oyedele, 2018;
37
38 Goodier and Gibb, 2007; Nadim and Goulding, 2010; Taylor, 2010) reported lack of
39
40 OSC knowledge and training, clients' indecision, finance, digitalization and
41
42 standardization of OSC, lack of awareness, unfavorable supply management system and
43
44 inadequate government support and policies as limiting factors for OSC adoption. In
45
46 Australia, (Blismas and Wakefield, 2009; Ngoc Nguyen et al., 2020) reported that
47
48 shortage of skills, adequate OSC knowledge and associated OSC costs limit OSC
49
50 adoption. In the US, (Gusmao Brissi et al., 2021b; Razkenari et al., 2020) observed
51
52 clients and ends users' attitudes, availability of finance, and design constraints are
53
54
55
56
57
58
59
60

1
2
3 inhibiting factors to OSC adoption. (Nanyam et al., 2017) noted that the technological
4 know-how of OSC is a limiting factor in India. (Gan et al., 2018; Jiang et al., 2020; Zhai
5 et al., 2014) reported that in China, inadequate knowledge of OSC by site workers and
6 managers and lack of industry standardization on OSC are the limiting factors. While
7 geographical locations, with their associated factors, cultural factors, and technological
8 advancements account for variance in the impact of these factors, finance, awareness of
9 OSC, technical know-how, attitude, and OSC execution documents seem to be core
10 factors that cut across the construction industries of many nations.
11
12
13
14
15
16
17
18
19
20
21

22 The most applicable influencing factor deduced and discussed from the Machine
23 Learning algorithms output are not entirely new factor. While *Future of OSC in Africa*
24 *and Nigeria, Level of Guidance of BIM and implementation and utilization on OSC*
25 appear in a modified form of earlier researcher's finding, *Accessibility to loans,*
26 *Awareness of OSC, Designers' attitude, consolidate* previously established influencing
27 factors (Daget and Zhang, 2019; Dixon-Ogbechi and Adebayo, 2020; Gusmao Brissi et
28 al., 2021; Salman et al., 2013; Schoenborn, 2012; Wuni and Shen, 2020b). Machine
29 Learning feature selection has brought out the strongly influencing factors in another
30 perspective away from many repeated prevailing factors analyzed by earlier researchers.
31
32
33
34
35
36
37
38
39
40
41
42

43 **7.0 Conclusion**

44
45
46 One of the essential factors that drive developed nations is infrastructure development
47 (Okonjo-Iweala, 2014). Many leaders of the Nigerian construction industry have decried
48 the continuous use of conventional means of construction, stating, "*the brick and*
49 *mortar will not take us far*" (Njoku and Adegboye, 2015). Virtually all the professional
50
51
52
53
54
55
56
57
58
59
60

bodies associated with the building industry have opined that there is a need to seek an alternative in addressing the housing shortage (Makinde, 2014).

Earlier studies highlighted various adoption barriers and drivers. This study has identified the most applicable OSC influencing factors to the NCI and added an OSC adoption predictive model as a contribution to knowledge. The essence of the model is to guide the NCI and her government when taking decisions on implementing OSC adoption. Their adoption policies can be evaluate using this model and considering the highlighted most applicable influencing factors in taking decisions on OSC adoption and how it may thrive in Nigeria or not. When the model result status indicates one (1), it shows the combined factors under observation would make OSC thrive but when it shows zero (0), the combined factors are not likely to make OSC thrive.

This research has identified funding, BIM application, the attitude of industry professionals, and belief in the future of OSC in Nigeria as the core factors that, if given serious consideration and attention, would help OSC thrive in Nigeria. In addition, availability of in-house building expertise for construction companies, good OSC construction knowledge among industry professionals, availability of skilled design and building personnel on and Offsite and favourable exchange rate are relating factors to the adoption success of OSC with Nigeria construction industry. It should be noted that one single factor would not determine OSC adoption success because the model examines interaction between factors. Therefore, the combined factors would determine the precision capability of the model to predict.

As the giant of Africa, Nigeria is expected to set the pace for Africa in terms of development and economy. Its over 200 million populace is rich enough to transform its

1
2
3 economic landscape if its real estate market is well harnessed. With the rapid
4
5 transformational development in the construction industry worldwide, there is a need to
6
7 join in on the moving train and on time. While the research focused on identifying the
8
9 critical factors underlining OSC adoption in Nigeria, the model outcome represents the
10
11 African continent, with Nigeria being the giant of Africa. The model, however, can serve
12
13 the construction industry of any geographical location if it is fed the appropriate data
14
15 from that region. Further research can improve the models' performance through
16
17 feature engineering and parameter optimization.
18
19
20
21

22 **8.0 Recommendation**

23
24
25 Offsite construction, in a short time, will become the new normal in the construction
26
27 industry. The professionals within the industry need to rally around this new normal
28
29 and give its potential a full realization (Sestino et al., 2020; Shankar & Clausen, 2020;
30
31 Ilori et al., 2002). Academia also should consider Offsite technology as a significant
32
33 course in the academic curricula. BIM should become a norm in all tertiary institutions
34
35 and construction workbooks. Provision should be made for OSC construction guide
36
37 within the Nigerian building codes. The era of manual design has wholly gone and
38
39 should not be retained in the annals of Nigerian construction practice. Industry players
40
41 should engage in continuous development programmes like expos, seminars,
42
43 workshops, etc.
44
45
46
47

48
49 Though this research did not cover the entire construction industry of Nigeria, it has
50
51 ensured it gathered data from the nation's largest cities where most of the most
52
53 significant infrastructural developments are on-going; and that represents the major
54
55 geo-political zones of the nation. Thus, this research hopes to lay the foundation for
56
57
58
59
60

1
2
3 critical underlining factors that other researchers can build on in promoting OSC within
4
5 the Nigerian context.
6

ML JOURNAL PAPER TABLES

Table 1: Literature Review Table

S/ No	Research Work	Author(s)	Analytic Tool	Factors observed
1.	Construction Technology Adoption Cube: An Investigation on Process, Factors, Barriers, Drivers and Decision Makers Using NVivo and AHP Analysis Study focus location: Note stated	Sepasgozar, S. and Davis, S. (2018)	NVivo and Analytics Hierarchy Process (AHP) Analysis	Productivity, efficiency, safety, overall improved performance
2.	Critical evaluation of off-site construction research: A Scientometric analysis Study focus location: Note stated	Hosseini, M. R., Martek, I., Zavadskas, E. K., Aibinu, A. A., Arashpou, M. and Chileshe, N. (2019)	Scientometric Analysis (Science Mapping)	Quality improvement, enhancement of structural reliability, increased productivity, shortening of construction time, reduction of labour and material wastage, promoting sustainability, health and safety, working conditions and subcontracting
3.	Adoption of unconventional approaches in construction: The case of cross-laminated timber Study focus location: United Kingdom	Jones, K., Stegemann, J., Sykes, J. and Winslow, P. (2016)	Capability, Opportunity, Motivation-Behaviour (COM-B) System	Resistance to change, knowledge and perception issues; technical and performance issues, economic challenges, institutional and habitual issues.
4.	An Investigation of Critical Factors and Constraints for Selecting Modular Construction over Conventional Stick-Built Technique Study focus location: Note stated	Salman, A., Maulik, Y., Lukkad, M. S. and Irtshad, A. (2013)	Standard Deviation	Greater efficiency and precision, safety, environmentally consciousness, less labour intensive, higher quality and significant schedule compression. Other factors include shortage of skilled construction craft workers, declining number of new workforce, low productivity of conventional method and increasingly stringent client requirements regarding cost, schedule and quality.
5.	Barriers to the transition towards off-site construction in China: An Interpretive structural modelling approach	Gan, X., Chang, R., Zuo, J., Wen, T. and Zillante, G. (2018)	Interpretive Structural Modeling Approach	Reduced construction waste, improved quality control, reduced construction noise and dust, improved health and safety, time and cost saving, low labour demand, reduced resource depletion, and a consequence increasing in predictability,

	Study focus location: China			productivity, whole-life performance, and profitability.
6.	Barriers And Challenges for Offsite Construction in UK Housing Sector	Arif, M., Kilian, P., Goulding, J., Wood, G. and Kaushik, A. (2017)	No Analytical Tool was used	Cost, perception and implementation barriers
7.	<i>Evaluating different stakeholder impacts on the occurrence of quality defects in off-site construction projects: A Bayesian-network-based model</i>	Yu, T., Man, Q., Wang, Y., Shen, G. Q., Hong, J., Zhang, J. and Zhong, J. (2019)	<i>Bayesian-network-based model</i>	Quality defects caused by mis-operations of construction workers, and ineffective quality inspection and testing during onsite assembly and construction. Reduction in waste generation, green house gas emission, material/resource consumption.
8.	Analysis and visualization of stakeholder relationship in Off-site construction: Social Network Analysis approach	Ngoc-Nguyen, B., London, K. and Zhang, P (2020)	Social Network Analysis	Interrelationship and communication among Off-site construction stakeholders, shortened schedule, remarkable buildability and increased on-site safety, project cost and time certainty, reduced waste generation, improved quality,
9.	Factors affecting prefabricated construction promotion in China: A structural equation modeling approach	Jiang, W., Huang, Z., Peng, Y., Fang, Y. and Cao, Y. (2020)	Structural Equation Modeling Approach	High waste generation rate, weak scale of economy, lack of skilled workers, high risk and large labour demand. Summarily, the factors are categorized as policy, technology, management, market and cost factors.
10.	Factors impeding the off-site production of housing construction in China: an investigation of current practice	Zhai, X., Reed, R. and Mills, A. (2014)	Exploratory Factor Analysis	Relative inferior quality, lower productivity, excessive use of resources, high energy consumption, large amounts of construction waste, high levels of environmental pollution, poor labour force health and safety records
11.	Implementing an Offsite Construction Strategy: A UK Contracting Organization Case Study	Vernikos, V., Robery, P., Nelson, R. and Goodier, C. (2013)	No Analytical Tool was used	Lack of plans of integrating OSC business model into firm's core business plan, up-front cost to set up a manufacturing facility, availability of good external specialist suppliers. Strong management of information and quality within the manufacturing facility is equally required.

Table 2: Factors Deduced from Questionnaire with variable tag

S/No	SECTION A (Social environment factors)	VARIABLE TAG
1.	Government Policies on Production	VR1
2.	Government Policies on Importation	VR2
3.	Cultural Heritage Factors about OSC (i.e., being used to a style of building due to living in an environment/location e.g., belief in the use of thatched roof on a round building in Northern Nigeria.)	VR3
4.	Historical Factors (Failure of OSC in places where it was used)	VR4
5.	Belief System (Religious beliefs on building type and style)	VR5
6.	Environmental factors (Weather, Climate, etc.)	VR6
SECTION B (Attitudes)		
7.	Designers' attitude (i.e., Architects, Civil/Structural, Building, Mech. and Elect. Engrs.)	VR7
8.	Construction Site Managers	VR8
9.	Construction site workers	VR9
10.	End Users/ Building Occupiers	VR10
11.	Client/ Investor desire to use OSC for construction	VR11
12.	Government	VR12
SECTION 3 (Awareness Level)		
13.	Awareness of OSC by Designers	VR13
14.	Awareness of OSC by Construction Managers	VR14
15.	Awareness of OSC by Construction Site Workers	VR15
16.	Awareness of OSC by End Users/ Building Occupiers	VR16
17.	Awareness of OSC by Client	VR17
18.	Awareness of OSC by Government	VR18
SECTION 4 (Funding)		
19.	Level of Accessibility to loans	VR19
20.	Level Accessibility to favourable exchange rate	VR20
SECTION 5 (Documentation and Logistics)		
21.	Level of Availability of bespoke OSC manufacturing company	VR21
22.	Availability of new or amended form of Construction Contracts that focus on OSC.	VR22
23.	Availability of Contract Documentation relating to OSC	VR23
24.	Supply chain integration for OSC.	VR24
25.	Supply chain management for OSC.	VR25
26.	Technological Advancement (OSC Installation technique)	VR26
SECTION 6 (Skill availability)		
27.	Level of availability of in-house OSC design expertise for manufacturing companies	VR27
28.	Level of in-house OSC building expertise for construction companies	VR28
29.	Level of availability of skilled personnel at Design Companies	VR29
30.	Level of availability of skilled building personnel on construction site	VR30
31.	Construction knowledge of OSC among construction professional bodies in Nigeria	VR31
32.	Level of training/education in Nigerian universities on OSC designs	VR32
33.	Level of guidance of BIM implementation and utilization on OSC	VR33
SECTION 7 (Cost)		
34.	Cost of OSC Components	VR34
35.	Cost of OSC Installation	VR35
36.	Traditional Construction Method	VR36
37.	OSC Construction Method	VR37
SECTION 7

Table 5: Most Important Factors from Feature Selection

S/ No	SECTION A	FACTOR NOTATION
1.	Level of Accessibility to loans	VR19
2.	Awareness of OSC by Government	VR18
3.	Awareness of OSC by Construction Managers	VR14
4.	Awareness of OSC by Designers	VR13
5.	Level of guidance of BIM implementation and utilization on OSC	VR33
6.	Designers' attitude (i.e., Architects, Civil/Structural, Building, Mech. and Elect. Engrs.)	VR7
7.	Future of OSC in Africa and Nigeria	VR38
	SECTION B	
a.	Level of in-house OSC building expertise for construction companies	VR28
b.	Construction knowledge of OSC among construction professional bodies in Nigeria	VR31
c.	Level of availability of skilled personnel at Design Companies	VR29
d.	Level Accessibility to favourable exchange rate	VR20
e.	Level of availability of skilled building personnel on construction site	VR30
